

Camera App – Simple Requirement (Technical Test)

Goal:

Create an Android Camera App which can take **Videos** with **Date, Time and Location** shown on them.

Main Features

1. Camera Capture

- Take **video**.
- While recording, display and stamp the **current date, time, and location** on the video.

2. Default Settings

- **Video size:** 1080 × 720 resolution (called 1080p quality).
- **Time:** Use device current date and time.
- **Location:** Use current GPS location.

3. Settings Screen

- **Theme:** Choose between System, Light, Dark.
- **Default Mode:** Choose Video as the default start mode.
- **Video Resolution:** Choose between 720p, 1080p, 4K, or Auto (device best).
 - Show the current selected resolution on the camera screen.
 - User can also change it temporarily from the camera screen.
 - Whatever user selects should be saved and used next time also.
- **Timestamp:** Let user choose the date/time format and timezone.
- **Location Tagging:**
 - Enable or Disable location tagging.
 - If Enabled → Stamp location (Lat/Long or City) on video.
 - If Disabled → No location collected or shown.
 - Show a small **Location ON/OFF badge** on the camera screen.

4. Storage

- Save all videos in a fixed folder inside the phone gallery.

- Add a setting: auto-delete files after N days (like recycle bin).
-

Expected Behaviour

- When user takes a video, it must **show date, time, and location** on it.
- If location is OFF, it should **not ask for location permission** and must still work.
- Resolution and location settings should be **remembered** for the next app launch.
- The app should be **very simple and clean**, no extra menus or complex UI.

[App Start]

[Camera Screen]

[Shutter Button Pressed]

[Capture Video]

[Add Date + Time + Location Stamp]

[Save to Gallery Folder]

[Push to API]
